

Item 10 – Presentation of District Static Water Level Application & Hydrograph

One of the District Management Plan objectives is to provide board members with all recorded water level measurements once every three years. Management determined that the Board would be given access to the data every year and in real time.

Half Associates was tasked to provide anyone using the District websites the ability to access not only collected water level measurements but allow the wells to be filtered by aquifer and provide a visual hydrograph for each of the wells.

The application has been launched, and the Board will receive a short demonstration and training on how to use the tool. This portal will be the sole source of information for board members to view and understand aquifer impact from pumping.
