

ATTACHMENT 3 – REFERENCE MATERIALS

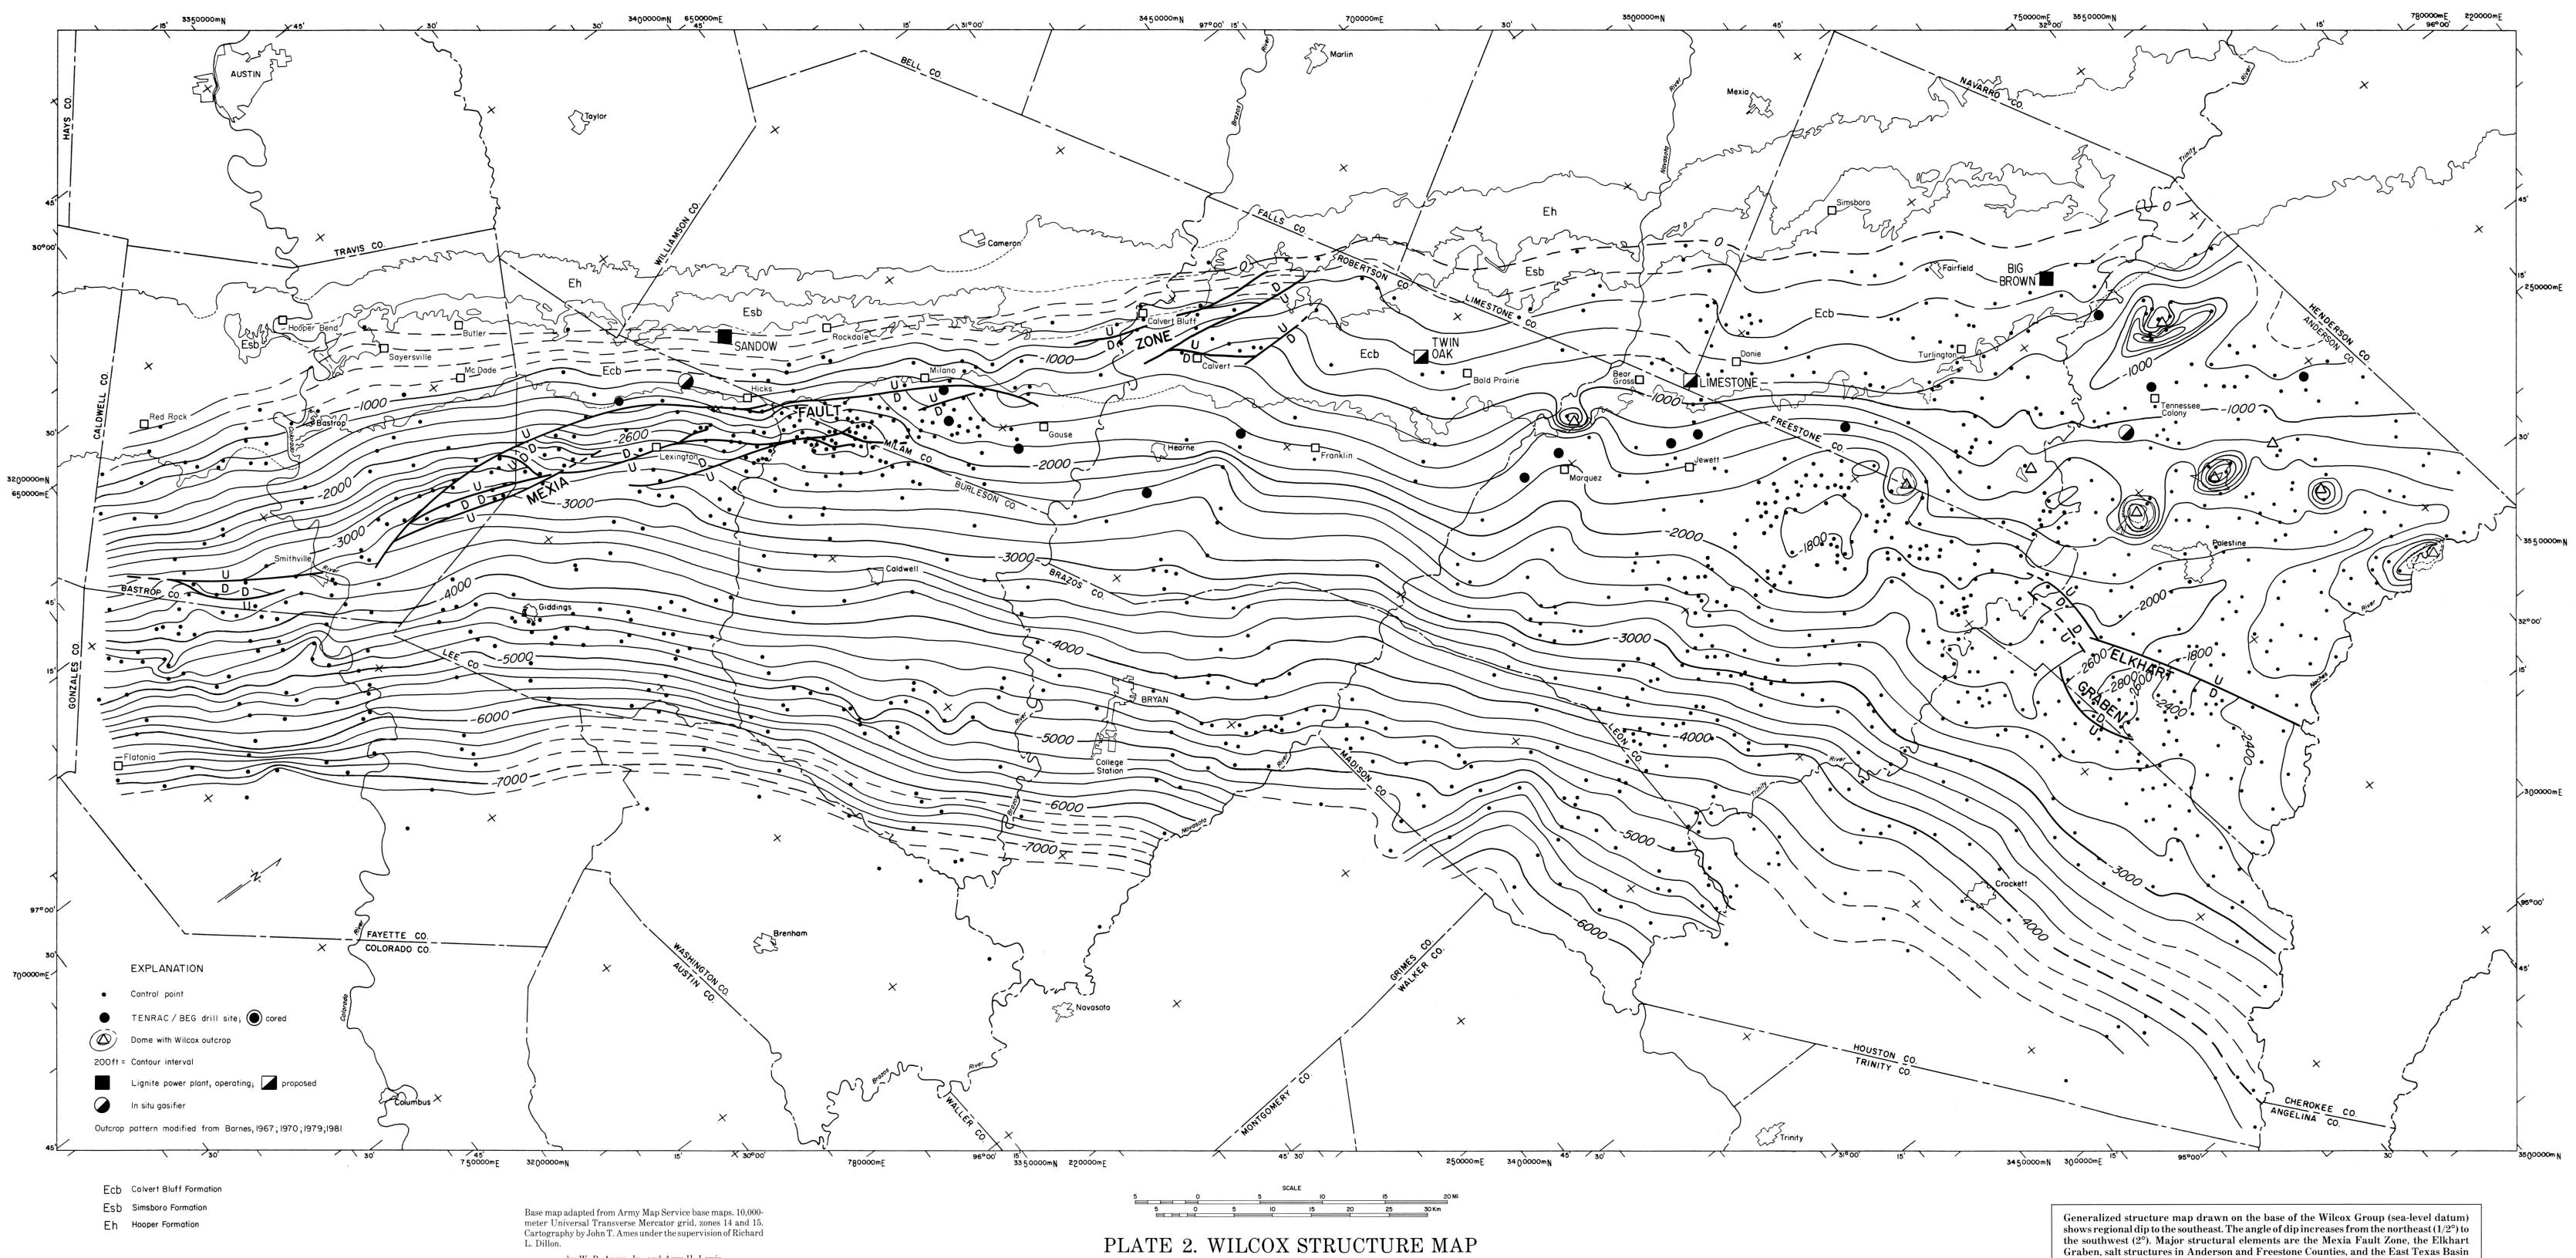

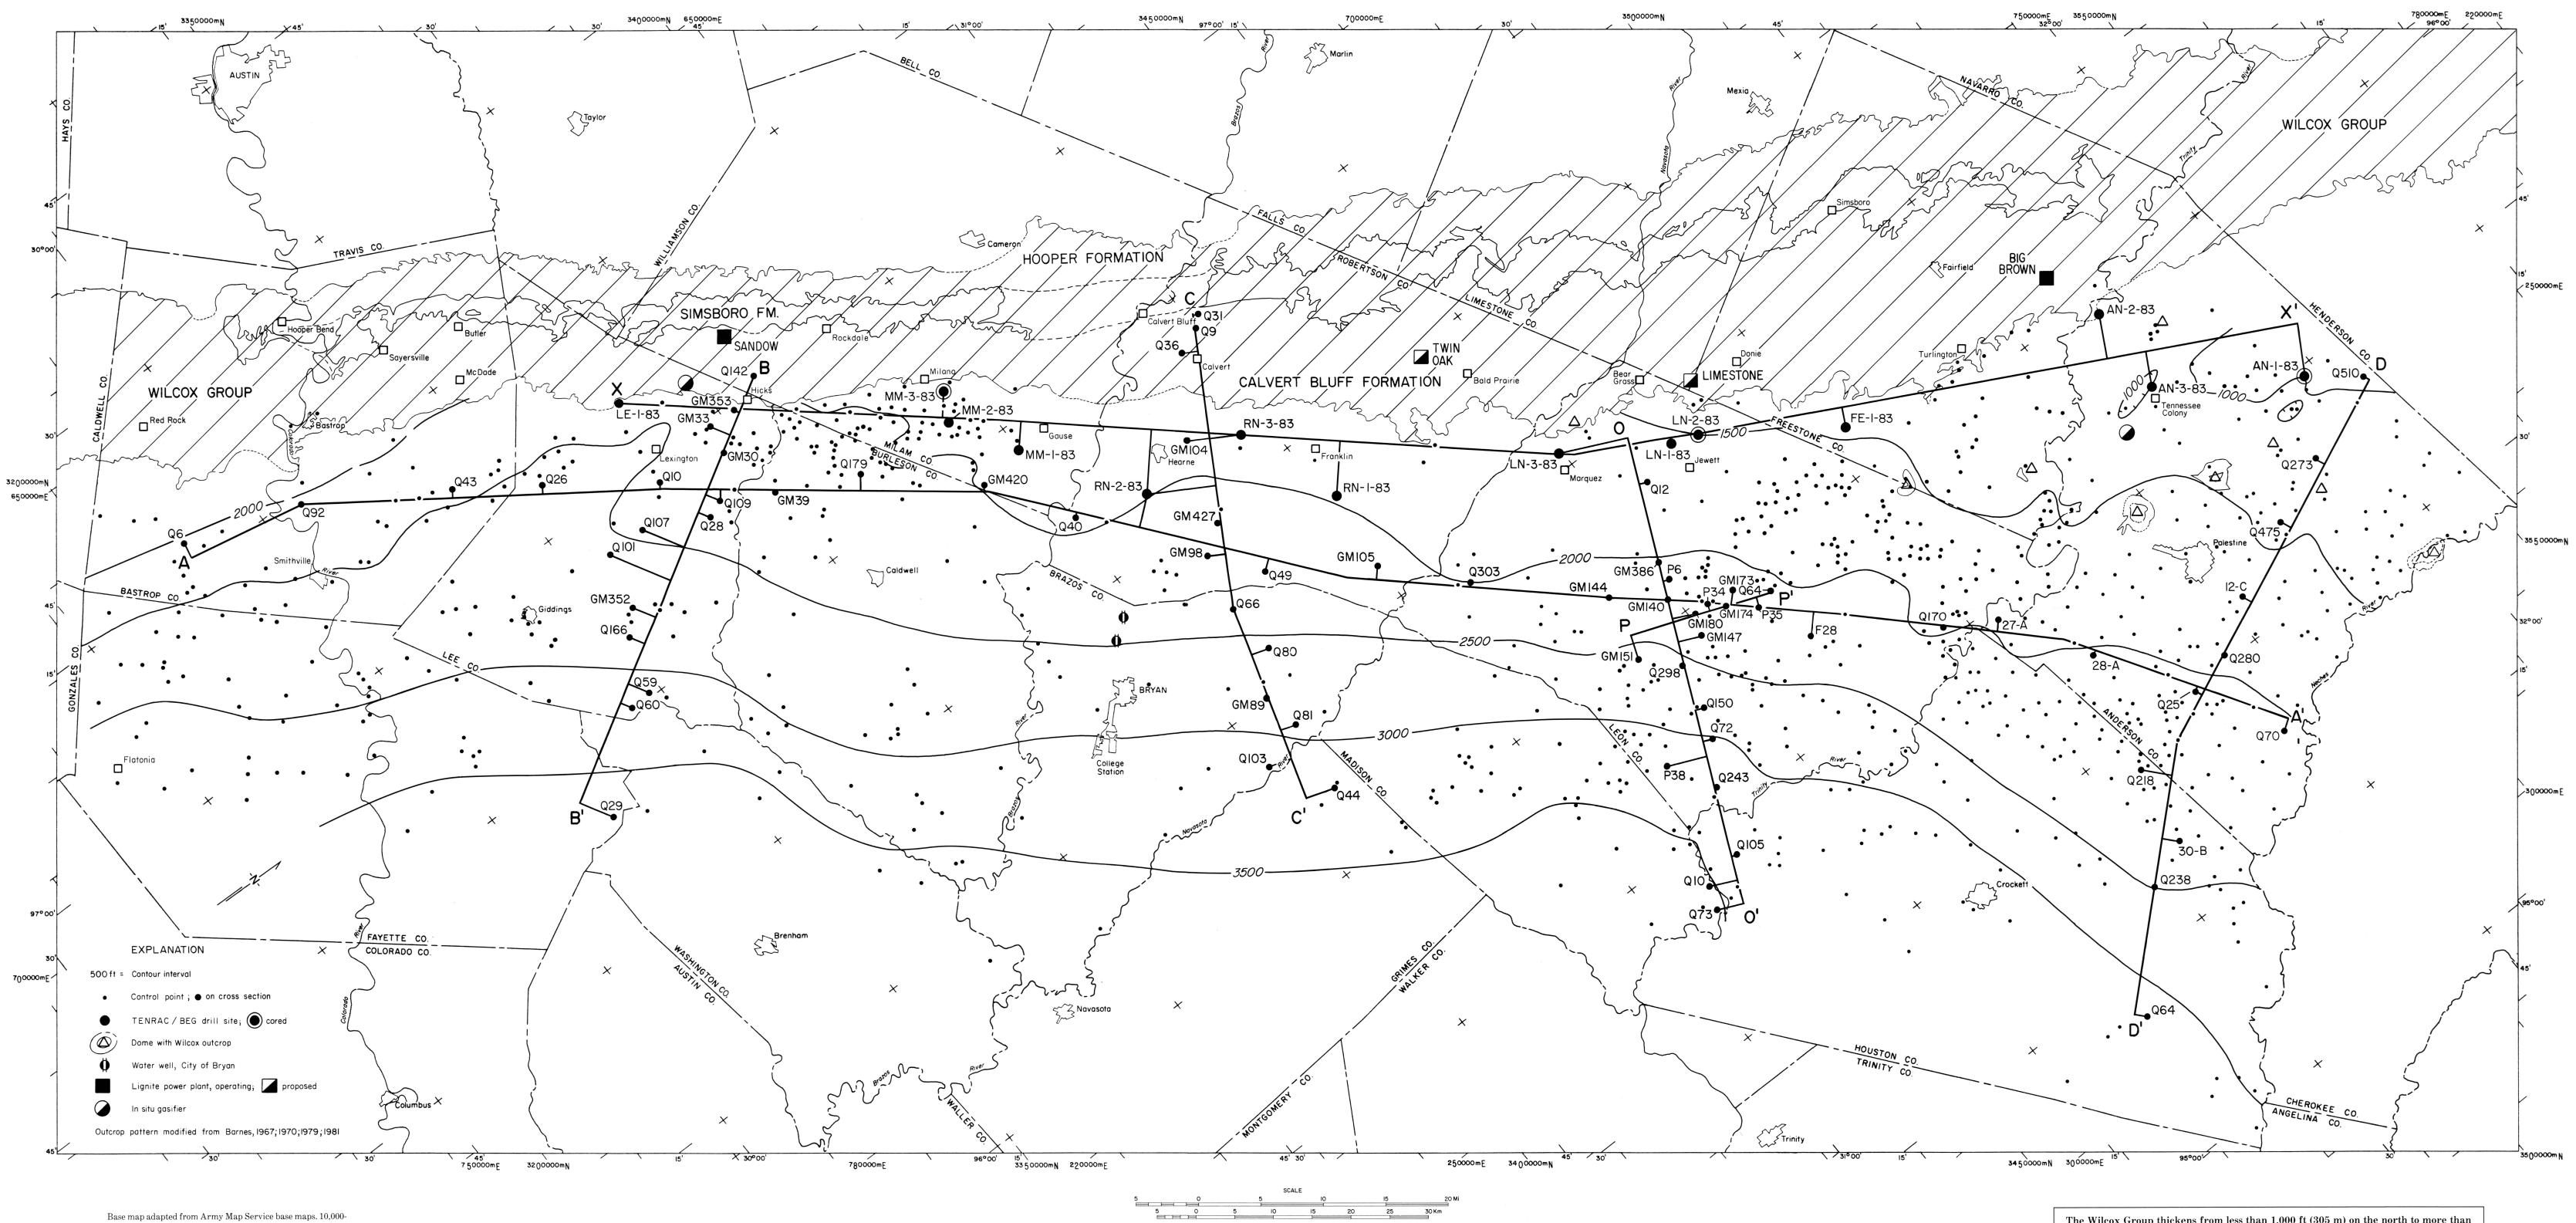

PLATE 2 THE WILCOX GROUP AND CARRIZO SAND (PALEOGENE) IN EAST-CENTRAL TEXAS: DEPOSITIONAL SYSTEMS AND DEEP-BASIN LIGNITE

Graben, salt structures in Anderson and Freestone Counties, and the East Texas Basin (fig. 2).

THE UNIVERSITY OF TEXAS AT AUSTIN BUREAU OF ECONOMIC GEOLOGY W. L. FISHER, DIRECTOR

Base map adapted from Army Map Service base maps. 10,000meter Universal Transverse Mercator grid, zones 14 and 15. Cartography by John T. Ames under the supervision of Richard L. Dillon.

by W. B. Ayers, Jr., and Amy H. Lewis

PLATE 3. WILCOX ISOPACH MAP AND LOCATIONS OF CROSS SECTIONS

PLATE 3 THE WILCOX GROUP AND CARRIZO SAND (PALEOGENE) IN EAST-CENTRAL TEXAS: DEPOSITIONAL SYSTEMS AND DEEP-BASIN LIGNITE

The Wilcox Group thickens from less than 1,000 ft (305 m) on the north to more than 3,500 ft (1,065 m) at the basinward margin of the study area. The local increase in thickness in central Lee County is attributed to syndepositional movement along the Mexia Fault Zone (fig. 2 and pl. 2).

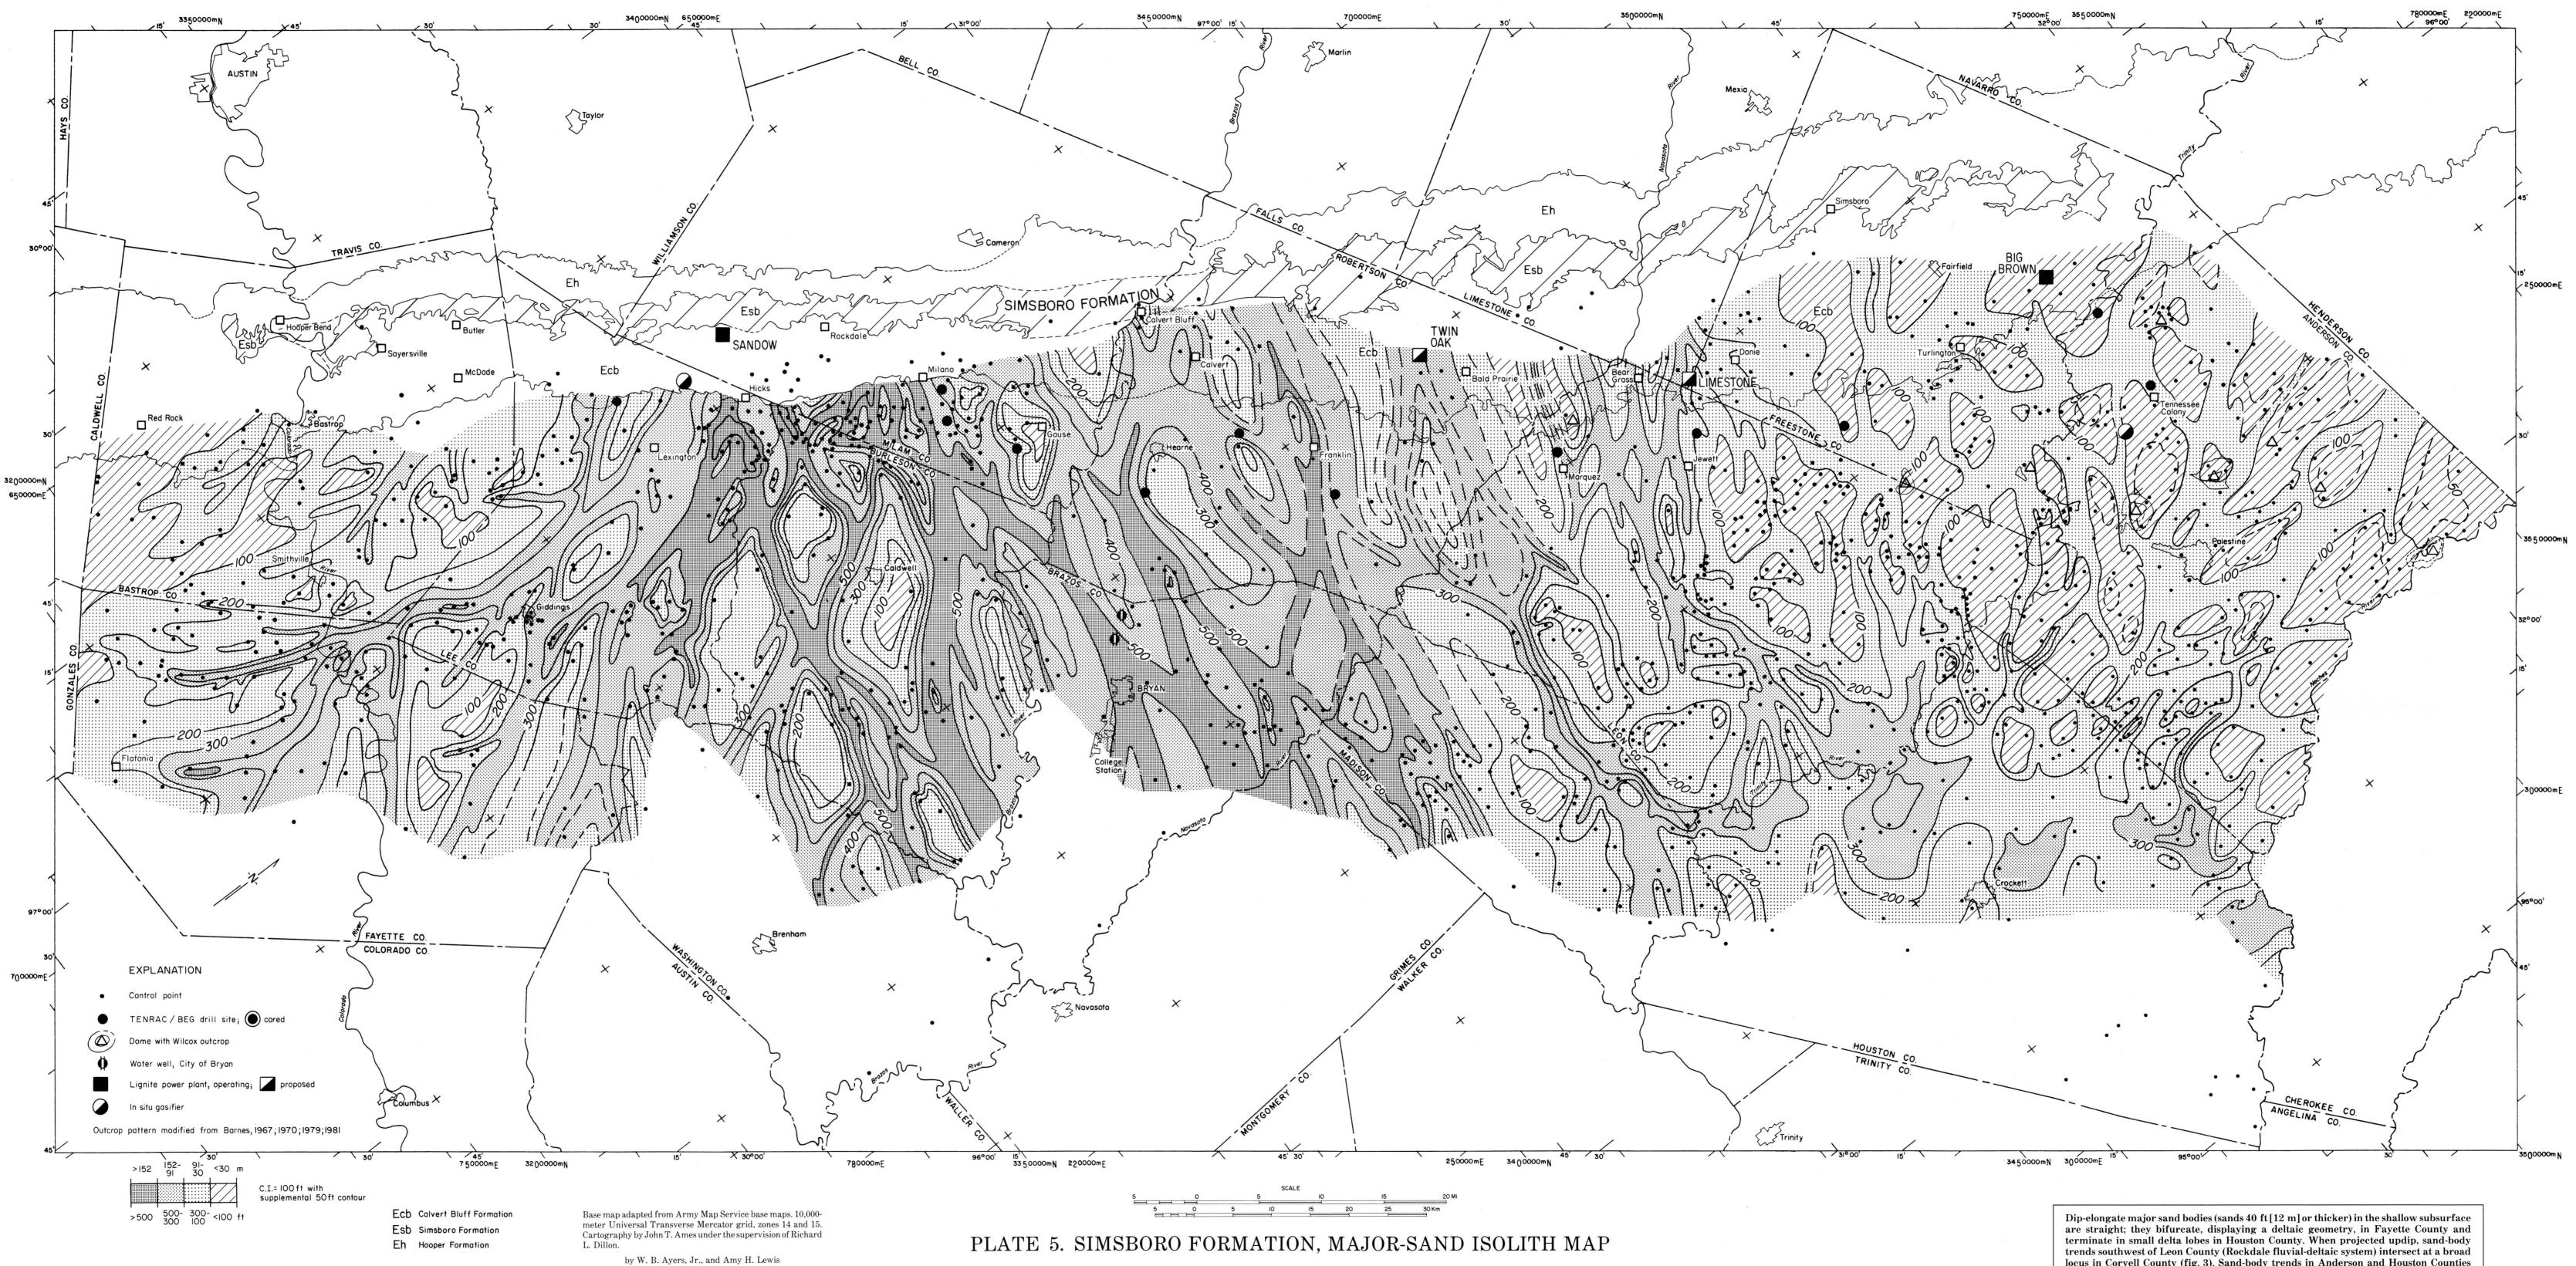

PLATE 5 THE WILCOX GROUP AND CARRIZO SAND (PALEOGENE) IN EAST-CENTRAL TEXAS: DEPOSITIONAL SYSTEMS AND DEEP-BASIN LIGNITE

Dip-elongate major sand bodies (sands 40 ft [12 m] or thicker) in the shallow subsurface are straight; they bifurcate, displaying a deltaic geometry, in Fayette County and terminate in small delta lobes in Houston County. When projected updip, sand-body trends southwest of Leon County (Rockdale fluvial-deltaic system) intersect at a broad locus in Coryell County (fig. 3). Sand-body trends in Anderson and Houston Counties (secondary fluvial system with sources to the north and northeast) are directed into the axis of the East Texas Basin (fig. 2 and pl. 2).
