

## **Item 9c – Update of GMA 12 Regional Planning Meeting**

GMA 12 representatives met in Milano, Texas on Friday, August 2, 2019 to discuss:

- Joint planning efforts
- Results of the initial predictive scenario GAM runs for the current planning cycle
- Discussion of DFC expressions among GMA members

### **Predictive Scenarios**

Six GAM runs were performed and presented at the meeting. The runs are as follows:

- PS 1 - All permitted production ramped to full permitted amounts from 2020-2070
- PS 2 - All permitted production ramped to 75% of permitted amounts from 2020-2070
- PS 3 - All permitted production ramped to 50% of permitted amounts from 2020-2070
- PS 4 – PS 6 - Each of the above scenarios will be run using both normal annual recharge and drought of record recharge placed in the middle of the planning horizon
- Only currently permitted production was used in the GAM runs

The GMA representatives had a lengthy discussion concerning what type run should be performed next. All district representatives were asked to correct or revise any well pumping file in short order enabling the next predictive run. The group settled on the following predictive scenario to be performed and presented at the next planning meeting the first week of October, 2019.

- PS 2 will be run with revised files and adjusted ramp up time frames for the first DFC predictive scenario
