

Item 11c | Simsboro Mitigation Management Depletion Zone | September 2024

446 Simsboro water wells have been visited, verified as screening the Simsboro Aquifer, measurements and location data collected and placed on the UW Brazos Valley Farms LLC mitigation list. An additional 73 wells are on the mitigation list but are yet to be visited. New wells are continuously being added as a well-by-well, log-by-log search is done by District staff.

District staff has been redirected during September toward obtaining late summer and early fall water level measurements from all designated monitoring wells in all aquifers. Identification of and adding Simsboro wells to the mitigation list should restart soon after October 15th.

We are currently working in the outer edges of the area moving NE to SW and N to S. The objective is to touch every suspected Simsboro well north of Highway 7 and north of the Walnut Creek mine site by November 15, 2024. We will then canvas the area from Highway 7 south toward the intersection of FM 979 and FM 2293. The final area will be the Petteway community and all areas NE, N & NW.

The project is scheduled to be completed by the end of 2024.
