

Item 10c | Simsboro Mitigation Management Depletion Zone | October 2024

527 Simsboro water wells have been preliminarily identified or visited and verified as screening the Simsboro Aquifer. Water level measurements and location data has been collected on those receiving site visits and placed on the UW Brazos Valley Farms LLC mitigation list. New wells are continuously being added as a well-by-well, log-by-log search is done by District staff.

District staff has been able to refocus on completing this project having wrapped up the late summer/early fall water level measurements from all designated monitoring wells in all aquifers. Identification of and adding Simsboro wells to the mitigation list restarted November 5th.

We are currently working north and west of the Oak Grove Management power plant. The objective is to touch every suspected Simsboro well south of Highway 7 and north of the Walnut Creek mine site by December 15, 2024. The final area to be canvassed will be the Petteway community and all areas N & NW.

The goal is to have the project completed by the end of 2024.
