

Item 6 – Presentation on Oil/Gas Wells Overlying the Eagle Ford Shale

Joshua Brownlow, doctoral candidate from Baylor University, will present data he has compiled regarding every oil and gas well that has been drilled in counties overlying the Eagle Ford Shale. This is of interest to the District in two ways.

1. A road map for identifying future oil/gas wells for conversion to monitoring wells.
2. An oil/gas well typically has at least one water well associated with it. Many times there are two or more wells that were drilled for rig supply and hydraulic fracturing. This will be an excellent field guide for District staff.

This information is being shared with us at no cost to the District. Two groundwater conservation districts south of San Antonio funded the work.
