

Wording of Proposed Rules on Static Water Level Measurements

During a lengthy discussion with a stakeholder, two items were identified that both John Seifert and I feel would enhance the integrity of the static water level measurement protocol being proposed. Those two items for your consideration are:

E-line Measurement Protocol

13. If the well is determined to in recovery phase or does not fall within the .05' variance, the static water level measurement obtained will not be entered into the District database.

Airline Measurement Protocol

16. Pressure gauges used to determine static water levels will be calibrated as per the manufacturer's recommendations.

It is the recommendation of the General Manager the Board adopt the above wording for the specific protocol listed in addition to adopted proposed wording already being considered.
