

Item 9 – Determination of Initial GAM Methodology for 2021 DFCs

After consideration of several avenues to properly use the updated groundwater availability model and express the desired future conditions in a practical form, John Seifert, along with other consultants for GCDs in GMA 12, recommends using the Run 3 method to represent pumping in the shallow flow system plus Brazos River Alluvium. Desired Future Conditions (DFCs) would continue being expressed by aquifer.

It is the recommendation of the General Manager that the Board accept and approve the Run 3 method as the initial methodology to be used during the 2021 Desired Future Conditions planning process.
