

## **Wording of Proposed Rules on Static Water Level Measurements**

During a lengthy discussion with a stakeholder, three items were identified that both John Seifert and I feel would enhance the integrity of the static water level measurement protocol being proposed. The three items for your consideration are:

### **E-line Measurement Protocol**

13. If the well is determined to in recovery phase or does not fall within the .05' variance, the static water level measurement obtained will not be entered into the District database.

### **Steel Tape Measurement Protocol**

12. If the well is determined to in recovery phase or does not fall within the .05' variance, the static water level measurement obtained will not be entered into the District database.

### **Airline Measurement Protocol**

16. Pressure gauges used to determine static water levels will be calibrated as per the manufacturer's recommendations.

**It is the recommendation of the General Manager the Board adopt the above wording for the specific protocol listed in addition to adopted proposed wording already being considered.**
